

Stirling Engine Helicopter

Description:

Designed and manufactured a stirling engine helicopter out of aluminum, brass, and steel that ran at a consistent 500 RPM.

Takeaways:

Fortified CAD skills and learned various methods of precision machining, including CNC as well as the use of manual lathes and mills.

Inspiration and Design

- Inspired by a youtube channel named [KenToonz](#)
- Drew a rough sketch of the concept
 - Designed a pulley mechanism rather than bevel gears to translate rotation to tail
- Met with my professor to discuss ideas and methods for manufacturing
- Completed the CAD in SolidWorks following ASME drawings for predefined parts
- Created my own ASME drawings for open design parts
